Automotive Electronics

Product Information Lambda Probe Interface IC - CJ125

Integrated circuit for continuous lambda regulation with Ri measurement

The integrated circuit CJ125 is a control and amplifier circuit for a wide range λ -Sensor LSU4.x for the continuous regulation of λ in combination with the sensor in the range of λ = 0.65... • (air).

Customer benefits:

- Excellent system know-how
- Smart concepts for system safety
- Secured supply
- Long- term availability of manufacturing processes and products
- QS9000 and ISO/TS16949 certified

Features

- Currents and Voltages (box 1)
- Pump current control (boxes 2a to 2b)
- Pump current sense amplifier (boxes 3a to 3b)
- Lambda output amplifier (box 4)
- Virtual ground voltage source for sensor and pump current control (box 5)
- Nernst cell reference voltage source (box 6)
- Oscillator (box 7)
- Circuit for Ri or Rical measurement (boxes 8a to 8d)
- Diagnostic of sensor lines (box 9)
- Diagnostic of external heater (box 10)
- Serial-Peripheral-Interface (SPI; box 11)
- Programmable reference pumping currents (box 12)
- Suppression of Ri-measurement (box 13)

Application circuit (only proposal!)

The application circuit of the CJ125 consists of the

 Capacitor between [VCC] and [GND] to stabilize the supply voltage VCC

following parts:

- Capacitor between [UB] and [GND] to stabilize the supply voltage VUB
- Capacitor between [CF] and [GND] to filter the lambda signal
- Capacitor between [UA] and [GND] to stabilize lambda signal output
- Capacitor between [UN] and [GND] to stabilize nernst signal
- Capacitor between [/RST] and [GND] to stabilize reset signal
- Shunt between [IA] and [IP] for pump current sensing
- Resistor between [IA] and [UP] to compensate parasitic effects of the lambda sensor
- Resistor between [US] and [UP] to feed the nernst cell reference voltage into the pump current control circuit
- Resistor between [UP] and [UN] for leakage detection
- Resistor between [RF] and [CF] to filter the lambda signal
- Capacitor between [UR] and [GND] to stabilize the output signal for ADC
- Capacitor between [UN] and [GND] for filtering
- Resistor between [RM] and capacitor at [CM] for adjustment of Ri measurement current
- Capacitor between [CM] and resistance at [RM] for DC filtering
- Resistor between [RS] and [VM] for adjustment
- Resistor between [DIAHD] and Drain of the external heater
- Resistor and capacitor before [UN] for filtering

SOIC24

PLCC28

LQFP32

Pin description

Pin	Description
UB	Power supply input (14V)
VCC, VCCSa)	Power supply input (5V)
GND, GNDSb)	Ground
VM	Virtual ground of pump current control and of the LSU (0.5VCC)
US	Nernst cell reference voltage (450mV)
IP	Inverting input of pump current amplifier (shunt voltage)
IA	Non inverting input of pump current amplifier and output of the pump current control
RF	Output of pump current amplifier (-> external filter)
CF	Input of lambda output amplifier (after external filter)
UA	Output of lambda output amplifier
UP	Non inverting input of pump current control
UN	Inverting input of pump current control respective in-/output for Ri-measurement (LSU)

Pin	Description
RM	Output Ri-measurement current (DC)
CM	Input Ri-measurement current (AC, DC free)
RS	In-/output Ri-calibration measurement
UR	Output Ri-signal (analogous)
DIAHG	Diagnosis input (gate of external transistor)
DIAHD	Diagnosis input (drain of external
	transistor)
SCK	Input SPI-clock (from μC)
SI	Input serial data (SPI, from μC)
SO	Output serial data (SPI, to µC)
/SS	Slave select (SPI, from μC)
/RST	Input Reset
OSZ	$R_{extern} = 10k\Omega$

- $^{\rm a.)}$ For hybrid version it is recommended to connect $\,$ VVCS with the reference VCC for the ADC $\,$
- $^{\rm b.)}$ For hybrid version it is recommended to connect $\,$ GNDS $\,$ with the reference ground for the $\,$ ADC $\,$

Failure bits ^{a)}	Ext. heater	Sensor ^{b)}
0 0	Short circuit to ground	Short circuit to ground
0 1	Open load	Low battery c)
10	Short circuit to Vbat	Short circuit to Vbat
1 1 ^{d)}	No failure	No failure

- a) Only each failure of the sensor leads to a switch off of pump current and virtual ground
- b) Failure identification at UN must be enabled with ENSCUN
- c) Open load is not recognizable; bits used for low battery
- d) After RD_DIAG or if no failure is present; Failure bits will be restored if failure is still present

v: command valid/not valid; dc: don't care ("-")

x: 0 or 1; Z: tristate
